

PLATFORMS AND INTEGRATIONS

Platforms and integrations

Choose where to run Claude Code and what to connect it to. Compare the CLI, Desktop, VS Code, JetBrains, web, mobile, and integrations like Chrome, Slack, and CI/CD.

Claude Code runs the same underlying engine everywhere, but each surface is tuned for a different way of working. This page helps you pick the right platform for your workflow and connect the tools you already use.

Where to run Claude Code

Choose a platform based on how you like to work and where your project lives.

Platform	Best for	What you get
<u>CLI</u>	Terminal workflows, scripting, remote servers	Full feature set, <u>Agent SDK</u> , <u>computer use</u> on macOS (Pro and Max), third-party providers
<u>Desktop</u>	Visual review, parallel sessions, managed setup	Diff viewer, app preview, <u>computer use</u> and <u>Dispatch</u> on Pro and Max
<u>VS Code</u>	Working inside VS Code without switching to a terminal	Inline diffs, integrated terminal, file context
<u>JetBrains</u>	Working inside IntelliJ, PyCharm, WebStorm, or other JetBrains IDEs	Diff viewer, selection sharing, terminal session
<u>Web</u>	Long-running tasks that don't need much steering, or work that should continue when you're offline	Anthropic-managed cloud, continues after you disconnect
Mobile	Starting and monitoring tasks while away from your computer	Cloud sessions from the Claude app for iOS and Android, <u>Remote Control</u> for local sessions, <u>Dispatch</u> to Desktop on Pro and Max

The CLI is the most complete surface for terminal-native work: scripting and the Agent SDK are CLI-only. Third-party providers also work in VS Code. Enterprise Desktop deployments support Vertex AI and gateway providers; for Bedrock or Foundry, use the CLI or VS Code, or the Cowork on 3P research preview, which runs the Code tab on those providers. Desktop and the IDE extensions

trade some CLI-only features for visual review and tighter editor integration. The web runs in Anthropic’s cloud, so tasks keep going after you disconnect. Mobile is a thin client into those same cloud sessions or into a local session via Remote Control, and can send tasks to Desktop with Dispatch.

You can mix surfaces on the same project. Configuration, project memory, and MCP servers are shared across the local surfaces.

Connect your tools

Integrations let Claude work with services outside your codebase.

Integration	What it does	Use it for
<u>Chrome</u>	Controls your browser with your logged-in sessions	Testing web apps, filling forms, automating sites without an API
<u>GitHub Actions</u>	Runs Claude in your CI pipeline	Automated PR reviews, issue triage, scheduled maintenance
<u>GitLab CI/CD</u>	Same as GitHub Actions for GitLab	CI-driven automation on GitLab
<u>Code Review</u>	Reviews every PR automatically	Catching bugs before human review
<u>Slack</u>	Responds to @Claude mentions in your channels	Turning bug reports into pull requests from team chat

For integrations not listed here, MCP servers and connectors let you connect almost anything: Linear, Notion, Google Drive, or your own internal APIs.

Work when you are away from your terminal

Claude Code offers several ways to work when you’re not at your terminal. They differ in what triggers the work, where Claude runs, and how much you need to set up.

	Trigger	Claude runs on	Setup	Best for
<u>Dispatch</u>	Message a task from the Claude mobile app	Your machine (Desktop)	<u>Pair the mobile app with Desktop</u>	Delegating work while you’re away, minimal setup
<u>Remote Control</u>	Drive a running session from <u>claude.ai/code</u> or	Your machine (CLI or VS Code)	Run <code>claude remote-control</code>	Steering in-progress work from another device

	Trigger	Claude runs on	Setup	Best for
	the Claude mobile app			
<u>Channels</u>	Push events from a chat app like Telegram or Discord, or your own server	Your machine (CLI)	<u>Install a channel plugin</u> or <u>build your own</u>	Reacting to external events like CI failures or chat messages
<u>Slack</u>	Mention <code>@Claude</code> in a team channel	Anthropic cloud	<u>Install the Slack app</u> with <u>Claude Code on the web</u> enabled	PRs and reviews from team chat
<u>Scheduled tasks</u>	Set a schedule	<u>CLI</u> , <u>Desktop</u> , or <u>cloud</u>	Pick a frequency	Recurring automation like daily reviews

If you're not sure where to start, **install the CLI** and run it in a project directory. If you'd rather not use a terminal, **Desktop** gives you the same engine with a graphical interface.

Related resources

Platforms

- **CLI quickstart**: install and run your first command in the terminal
- **Desktop**: visual diff review, parallel sessions, computer use, and Dispatch
- **VS Code**: the Claude Code extension inside your editor
- **JetBrains**: the extension for IntelliJ, PyCharm, and other JetBrains IDEs
- **Claude Code on the web**: cloud sessions that keep running when you disconnect
- Mobile: the Claude app for **iOS** and **Android** for starting and monitoring tasks while away from your computer

Integrations

- **Chrome**: automate browser tasks with your logged-in sessions
- **Computer use**: let Claude open apps and control your screen on macOS
- **GitHub Actions**: run Claude in your CI pipeline
- **GitLab CI/CD**: the same for GitLab
- **Code Review**: automatic review on every pull request
- **Slack**: send tasks from team chat, get PRs back

Remote access

- **Dispatch**: message a task from your phone and it can spawn a Desktop session
- **Remote Control**: drive a running session from your phone or browser
- **Channels**: push events from chat apps or your own servers into a session
- **Scheduled tasks**: run prompts on a recurring schedule
