

WHAT'S NEW

Week 21 · May 18–22, 2026

Use auto mode on the Pro plan and with Sonnet 4.6, see which skills, subagents, and MCP servers drive your plan limits in `/usage`, and review diffs with the new `/code-review` command.

Releases [v2.1.143](#) → [v2.1.149](#)

1 feature · May 18–22

Auto mode on the Pro plan CLI

Auto mode is now available on the Pro plan and supports Sonnet 4.6 alongside Opus. It replaces permission prompts with background safety checks: routine actions run without interrupting you, and destructive or suspicious ones are blocked and surfaced.

Update Claude Code, then cycle modes with Shift+Tab; auto mode appears once your account meets the requirements:

```
terminal
```

```
claude update
```

[Auto mode](#) →

Other wins

- + `/usage` now shows a per-category breakdown of what's driving your plan limits, attributing recent usage to skills, subagents, plugins, and individual MCP servers
- + "Extra usage" is renamed to "usage credits" across the CLI, and `/extra-usage` is now `/usage-credits`. The old name still works.
- + New `/code-review` command reports correctness bugs at a chosen effort level such
- + Background sessions now appear in `/resume` alongside interactive ones, marked with `bg`,

as `/code-review high`, and `--comment` posts findings as inline GitHub PR comments.
`/simplify` remains as a separate cleanup-only review.

- + `claude agents --json` lists live sessions as JSON for scripting, such as status bars and session pickers

- + `claude plugin disable` now refuses when another enabled plugin depends on the target, and `claude plugin enable` force-enables transitive dependencies

- + New `worktree.bgIsolation: "none"` setting lets background sessions edit the working copy directly without `EnterWorktree`, for repos where worktrees are impractical

- + Status line JSON input now includes GitHub repo and PR information when detected

and sessions pinned with `Ctrl+T` in `claude agents` stay alive when idle

- + The PowerShell tool is now enabled by default on Windows for Bedrock, Vertex, and Foundry users; opt out with `CLAUDE_CODE_USE_POWERSHELL_TOOL=0`

- + The `/plugin` marketplace browse pane shows projected context cost, and the Discover and Browse screens list a plugin's commands, agents, skills, hooks, and MCP/LSP servers before installation

- + Markdown output renders GFM task list checkboxes, and the `/diff` detail view scrolls with the keyboard

- + Enterprise: the `allowAllClaudeAiMcps` managed setting loads `claude.ai` cloud MCP connectors alongside `managed-mcp.json`
