

WHAT'S NEW

Week 26 · June 22–26, 2026

Authenticate MCP servers from your shell with `claude mcp login`, get a response to shell mode command output with the `!` prefix, and resume a conversation from before `/clear` with `/rewind`.

Releases [v2.1.185](#) → [v2.1.193](#)

2 features · June 22–26

Authenticate MCP servers from the CLI v2.1.186

New `claude mcp login <name>` and `claude mcp logout <name>` commands authenticate a configured MCP server from your shell instead of the interactive `/mcp` menu. `claude mcp login` runs the server's OAuth flow directly, and `claude mcp logout` clears the stored credentials.

Run the OAuth flow for a configured server without opening a session:

terminal

```
claude mcp login sentry
```

[Authenticate from the command line →](#)

Shell mode responds to command output v2.1.186

Commands you run with the `!` prefix now get a response from Claude once the output lands in the transcript, so you can run `! npm test` and get an explanation of the failures without a second prompt. The response costs the same as sending a normal prompt. To keep the earlier behavior, where the output is added to context without a

response, set `respondToBashCommands` to `false` in `settings.json`.

Run a command and get a response to its output:

Claude Code

```
> ! npm test
```

Shell mode with the `!` prefix →

Other wins

- + `/rewind` can now resume a conversation from before `/clear` was run
- + New `sandbox.credentials` setting blocks sandboxed commands from reading credential files and secret environment variables
- + Org-configured model restrictions now apply to the model picker, `--model`, `/model`, and `ANTHROPIC_MODEL`, with a “restricted by your organization’s settings” message when a restricted model is selected
- + New `autoMode.classifyAllShell` setting routes all Bash and PowerShell commands through the auto-mode classifier, and denial reasons now show in the transcript, the denial toast, and `/permissions`
- + New `claude_code.assistant_response` OpenTelemetry log event carries the model’s response text; deployments that already log prompt content start receiving it on upgrade, so set `OTEL_LOG_ASSISTANT_RESPONSES=0` to keep prompts only
- + Background subagents now surface permission prompts in the main session instead of auto-denying; the dialog shows which agent is asking, and Esc denies only that tool
- + `/install-github-app` can now install only the GitHub App and skip the Actions workflow and secret steps
- + Hosts you allow in the sandbox network permission dialog are remembered for the rest of the session instead of re-prompting on every connection
- + Streaming responses use about 37% less CPU, and long-session memory growth from the terminal output cache is reduced
- + `/review <pr>` now uses the same review engine as `/code-review medium`
- + Bash mode `!` commands get live file path autocomplete
